

ABSTRACT OF THE DISCLOSURE

5 A hinged unloading auger for an agricultural combine that reduces the portion of the unloading auger that extends beyond the rear end of the combine when the unloading auger is in its storage position. The horizontal section of the unloading auger includes a hinged joint that connects a first segment and a second segment. In the storage position, the joint is separated to provide a compact storage package. In the unloading position, the second segment is rotated around the hinge so that the axes of the first and second segments are coaxial.
